Full Stack

Hey there!

We are glad that you applied for our available fullstack position and we are expecting to have you in our team, but first we have a short assignment for you:

You are to code a simple website and ecommerce for an imaginary company.

This company is called Look After™. They have been working in the diapers market for quite a while. Look After has many costumers and they want to go online, for that our Software Engineer came up with some **requirements**:

The website must have a good UX;

The website must allow the user to read information about the company itself [you can mock some, just as social networks and contact information];

The website must have a shopping cart that ables the user to purchase diapers;

The website must have a complete purchase scenario(Choose item, send to cart, fill up address information, fill up billing information, confirm purchase with an overview screen);

The website must allow the user to cancel the purchase within 15 minutes, after that the system should show an message saying that the product was already sent.

[For that you will need to create some diapers, so feel free to get some pictures on the web]

The technical specifications are:

- The front-end should be done using Wordpress;
- The wordpress template must be done by yourself and not a already made one;
- The ecommerce part should be done using Woocommerce;
- The website must be done using PHP;

Extras:

- Come up with a way to put credits on the user account and whenever the user buys a diaper the money comes out from his credits and doesn't ask for the billing information.

Every assumption that you make is right, just need to be writing them down in the readme file when you send your final version.

Your test must be submitted to matheus@feracode.com with a link to a git repository with your final answer and a link to the website you created.

Every code, even not complete, will be analyzed.
